

Princess Sumaya University for Technology

Electronics Engineering Dept.

24221 Circuit Analysis I - Spring 2012

Quiz 2 - Form A

Name: Solution

Duration: 10 minutes

Instructions:

- No questions allowed.

- Show your work, final answer by itself does not count.

**Question 1: In the circuit below, find the current  $i_x$ . (5 points).**

$$\begin{aligned} I_y &= 6 \times \frac{8}{16} = 3 \text{ A} \\ I_x &= I_y \times \frac{8}{16} = 1.5 \text{ A} \end{aligned} \quad \left. \begin{array}{l} \\ \end{array} \right\} \text{using current division.}$$

**Question 2: Find the Voltage  $V_x$  in the circuit below (Hint: simplify the circuit first): (5 points).**

using voltage division

$$V_x = 9 \times \frac{1}{1+2} = 3 \text{ V}$$

24221 Circuit Analysis I - Spring 2012

Quiz 2 - Form B

Name: Solution

Duration: 10 minutes

Instructions:

- No questions allowed.

- Show your work, final answer by itself does not count.

**Question 1: In the circuit below, find the current  $i_R$  and the voltage  $V_x$ . (5 points).**

$$\begin{aligned} i_y &= 12 \times \frac{4}{8} = 6A \\ i_x &= 6 \times \frac{4}{8} = 3A \end{aligned} \quad \left. \vphantom{\begin{aligned} i_y &= 12 \times \frac{4}{8} = 6A \\ i_x &= 6 \times \frac{4}{8} = 3A \end{aligned}} \right\} \text{using current division}$$

**Question 2: Find the Voltage  $V_x$  in the circuit below (Hint: simplify the circuit first): (5 points).**

Using voltage division

$$V_x = 10 \times \frac{2}{2+3} = 4V$$
